

MODULAR PODIUMS

There are two kinds of module that can be used to build a podium: straight and angled. With these modules, you can quickly and easily create tall, wide, long and angled podiums to suit your needs, with access via a ramp and/or steps.

So with modular podiums, you can adapt and optimise your work space without the need to modify production methods.

Modules can be clipped on to each other using the side notches.

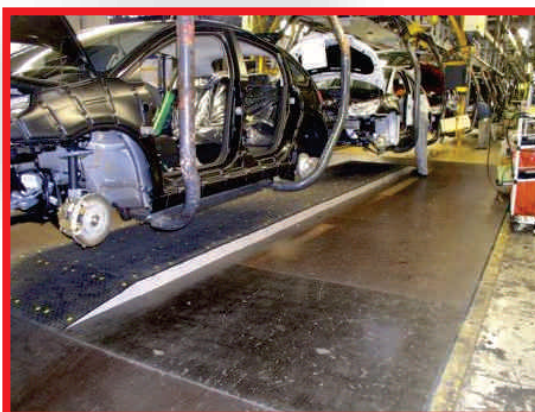

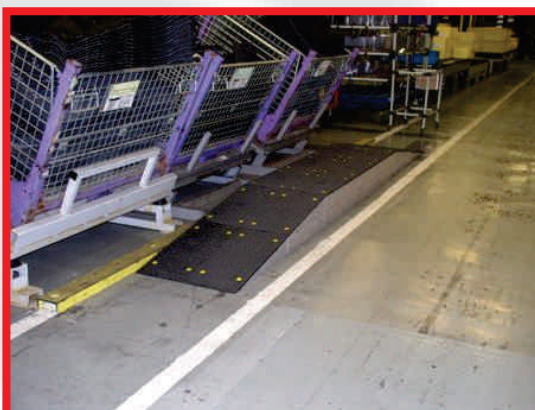

The top of the modules is covered with eight studs, so that the modules can be stacked on top of each other, or an elastomer anti-fatigue mat can be fitted.

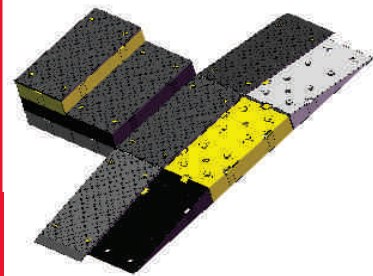

The four hollows are used to attach the mat using clips.

Two holes in the middle can be used to fix several levels of the podium to the ground for greater security (for example, using a pin and threaded bolt)

The podiums can be assembled by hand, with no need for any special tools.

Once dismantled, all parts can be used again to build another podium.
