# Leading to compact and space saving.

Overall length of axial cylinder is reduced.

New compact, space saving small vacuum suction cylinders, MVC series This is optimum for suction or transfer process of electric parts and precise parts

Direct mount surface (2 surfaces)

# High precision non-rotating mechanism

Non-rotating guide rod equipped.

This series is suited for the sucking and transfer of electric parts and precise parts, etc.

## Space saving design

Work piece sucking section and vacuum passage are provided at guide rod. This enables short overall length of cylinder and results in dramatic space saving.

### Direct 2 surfaces mount

Square shaped body enables direct mount on 2 surfaces.

# A variety of sucking pad available

Installation onto the rod end can be performed by just one piece of wrench.

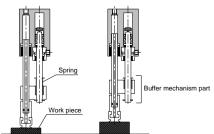

A variety of socket type sucking pad are available including 2 to 10 mm outer diameter and 24 different types (options).

## Miniature switch installation possible

F type switch can be integrated into the main body groove.

# **Buffering function**

When cylinder advances, even if driving section (sucking part) and work piece collide, buffer function protects a work piece and the cylinder.

For regular use 
Buffering function when activated

Space saving!

Guide rod

Socket type suction pad

Switch integrated

#### Pneumatic Components

# **Safety Precautions**

Always read before starting use

Refer to Intro 45 for general details on the cylinder, and to Intro 52 for details on the cylinder switch

Small cylinder with vacuum pad MVC Series

### **№** WARNING

### Design & Selection

- 1 If a hazardous situation may occur when using a system with a vacuum generator and the suctioned workpiece is dropped, provide a mechanical position locking measure for safety.
- 2 Do not use in areas containing corrosive or combustible gases. Do not suction these materials.
- 3 Select a vacuum generator with an appropriate suction flow. A low suction flow may result in a suction fault.
- 4 When using several MVC cylinders simultaneously, consider air consumption.
- 5 When using the MVC cylinder with buffer, the buffer stroke is 4 mm maximum. Do not use in applications exceeding 4 mm.

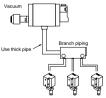

#### CAUTION

#### Installation & Adjustment

#### **Piping**

- 1 Do not use a spiral hose. If used on the vacuum side, the following faults may occur because of piping resistance:
  - (1) Delay in vacuum attainment time
  - (2) Drop in degree of vacuum at suction end due to drop in flow
  - (3) Unstable operation of vacuum switch
- 2 Note the following when using more than 2 MVC cylinder for 1 vacuum.
  - (1) If air leaks from 1 vacuum pad, the degree of vacuum drops and a suction fault occurs.
  - (2) Piping between the vacuum and branch must be thicker than piping between the branch and suction pad.

- 3 Use piping with a sufficient effective sectional area. Select pipes for the vacuum side having a sufficient effective section area so that the ejector's maximum suction flow can pass.
- 4 Measures against entry of foreign matter

Most problems in pneumatic devices are caused by the entry of foreign matter such as oil, cutting chips, burrs, and dirt. Flush air with the following procedures to prevent foreign matter from entering:

• Flush air (blow air) into pipe parts to remove cutting chips, etc., entering during machining.

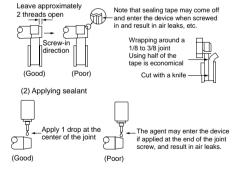

#### 5 Measures against air leaks

If the seal at joints, etc., in the vacuum line is incomplete, the vacuum may drop due to air leaks and cause the workpiece being suctioned and transferred to drop. Use sealing tape or a sealant as shown below to prevent this.

(1) Wrapping sealing tape

When using a right-handed screw, wrap the tape leftward from the screw-in direction

- 6 Install a switch with the designated tightening torque. If the tightening torque range is exceeded, the set screw, bracket, or switch, etc., may be damaged. If installed with a tightening torque less than the designated value, the switch installation position may devi-
  - Tightening torque: 29.4 (N-mm)

#### Small cylinder with vacuum pad, double acting/single rod type

# **MVC** Series

• Bore size: 6, 10 mm bore

#### Specifications

Descriptions	M¹	vc
Bore size mm	6 dia.	10 dia.
Actuation	Double acting/	single rod type
Working fluid	Compre	essed air
Max. working pressure MPa	0	.7
Min. working pressure MPa	0.15	0.1
Withstanding pressure MPa	1.	05
Vacuum port pressure	-101KPa to 0	.6MPa Note 1
Ambient temperature °C	0 to 60 (to be u	nfrozen) Note 2
Port size	M3	M5
Stroke length tolerance mm		1.0 0
Working piston speed mm/s	50 to	500
Cushion	Rubber	cushion
Revolvable angle tolerance Degree	±(	0.5
Lubrication	Not required (when lubrication	on, use turbine oil ISOVG32.)
Application pad	Please refer to Page 5	540, 545 about details.
Allowable energy absorption J	0.0046	0.035

Note 1. Pressurize vacuum port only when vacuum break. The burst pressure should not be greater than the working pressure of cylinder.

#### Except buffer specifications The specifications other than followings are as same as above.

Descriptions	MVC-*-*-B
Buffer stroke length mm	4
Buffer section spring load N	During operation: 1.12 (for buffer stroke length 4mm)
Revolvable angle tolerance (reference value) Degree	±2.6 (6 mm bore), ±2.0 (10 mm bore)

Note 1. Do not use this with more than 4mm buffer stroke length. Failure to observe this may cause malfunctions.

#### Stroke length

Bore size	Standard stroke	Max. stroke	For 2 switches, minim	um stroke length (mm)	For one switch, minimum stroke length (mm)			
(mm)	length (mm)	length (mm)	Reed switch	Proximity switch	Reed switch	Proximity switch		
6 dia.	5, 10, 15, 20, 25, 30	30	10	5	5	5		
10 dia.	5, 10, 15, 20, 25, 30	30	10	5	5	5		

Note 2. MVC with proximity switch should be used at ambient temperature 40 °C or less. Failure to observe this may cause switch detection defective.

Note 2. Revolvable angle tolerance of types with a buffer is the value at retracted end (Pull). The value at extended end (Push) may vary depending on stroke length. Please consult with CKD.

#### Switch specifications

Descriptions	Reed 2 wire	Proximity 2 wire	Proximity 3 wire					
Descriptions	F0H/V	F2H/V	F3H/V					
Applications	Programmal	ble controller	Programmable controller, relay					
Power voltage V	-	-	DC10 to 28					
Load voltage V	DC24	DC10 to 30	DC30 or less					
Load current mA	5 to 20 (Note 1)	5 to 20 (Note 1)	50 or less					
Current consumption mA	-	_	10 or less (at ON state) at DC24V					
Internal voltage drop V	4 or	4 or less						
Light		Yellow LED (ON lighting)						
Leakage current	1mA o	or less	10 micron A or less					
Lead wire length	Ctanded 4 (-ili-tant in de-	-htid- 0dt0 452)	Standard 1m (oil resistant vinyl					
(standard)	Standard Tm (oil resistant vinyi ca	abtire code 2 conductor 0.15mm <sup>2</sup> )	cabtire code 3 conductor 0.15mm <sup>2</sup>					
Max. shock resistance m/s <sup>2</sup>	294{30G}	980	{100G}					
Insulation resistance		20MΩ over at DC500V megger						
Withstand voltage		No failure at AC1000V for one minute.						
Ambient temperature °C		-10 to + 60						
Protection structure	IEC standard	ds IP67, JIS C 0920 (water tight type),	oil resistance					

Note 1: Maximum load current 20mA is the value at 25 °C. When ambient temperature around switch is higher than 25 °C, the value is lower than 20mA. (5 to 10mA at 60 °C)

#### Cylinder mass sheet

Cylinder mass	Cylinder mass sheet (9)

#### · Switch installation position

Note: This indicates switch installation position at shipment.

#### Switch installation position dimensions

	(mm)											
Switch mounting	Reed	switch	Proximity switch									
dimensions	F(	) <sub>H</sub>	F2 <sup>∨</sup> <sub>H</sub> , F3 <sup>∨</sup> <sub>H</sub>									
Bore size	RD	HD	RD	HD								
6 dia.	3	1.5	7.5	4								
10 dia.	4.5	3	9	5.5								

Note 1. Minimum stroke length of types with two reed switches is 10mm.

Note 2. MVC with reed switch cannot be installed on magnetic substance (iron plate etc.). Failure to observe this may cause switch detection defective.

Note 3. MVC with proximity switch should be used at ambient temperature 40 °C or less. Failure to observe this may cause switch detection defective.

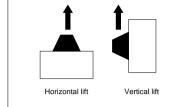

#### Technical data

#### ■ Formula of lifting capacity

$$W = \frac{ P \ X \ A }{ -101.3 } \quad X \quad \frac{1}{0.102} \qquad Where \left\{ \begin{array}{ll} W = \text{lifting capacity} & \text{(N)} \\ P = \text{vacuum} & \text{KPa} \\ A = \text{pad area} & \text{cm}^2 \end{array} \right.$$

- The value calculated by this formula is the average static lifting capacity without sideslips. This is a just theoretical value. When the actual design stage, use a safety factor such as 4 times for horizontal lifting, while 6 to 8 times for vertical lif
- When lifting up a work piece, consider a weighting by acceleration, and decide a sufficient safety factor.
- Pad diameter during sucking is approximate 10% larger.
- Be careful for center of gravity of a work piece. If a work piece leans, the suction force is remarkably reduced.

#### ■ Theoretical lift force

#### Round pad

Pad diameter (mm)	2	3.5	5	6	8	10	Ū
